State of AI in UK Property Investment

Wide, not deep.

UK business has adopted AI broadly and shallowly. Nobody has measured firms like yours. What is visible says acquisitions still runs on people.

35%

of UK firms with 10+ staff use AI, up from 12% in 2023

Measured · ONS 2026

1.6

AI technologies used by the average adopter, up from 1.4

Measured · ONS 2026

10%

of AI-adopting firms use it extensively

Measured · ONS 2026

Desk research on UK residential property investment firms.
Sources accessed 5 October 2026.

The one-page summary

The sector is unmeasured and, on visible evidence, unsystematised.

Official data shows AI spreading across UK business without going deep. Property's nearest measured neighbours are stuck between pilots and routine use. No public dataset covers founder-led residential investment firms, and the signals we could see point to deal flow that still runs on forms, phones and people. The growth ceiling for these firms is decision capacity. That is a systems problem, and the window to solve it ahead of the segment is still open.

Every figure carries a label: ■ **Measured** official statistics ○ **Adjacent** another sector ● **Observed** our own review □ **Analysis** our inference

1.6

AI use has nearly tripled to about 35% of UK firms, but the average adopter still uses only 1.6 AI technologies.

■ Measured · ONS, July 2026 · Section 2

10%

Only one in ten AI-adopting firms uses it extensively.

■ Measured · ONS, "early indications" · Section 2

55 / 35

55% of workers use AI; only 35% of firms do. Staff are ahead of the businesses they work for.

■ Measured · ONS, two surveys · Section 2

39 / 29

In commercial property, 39% are running AI pilots but only 29% use AI regularly.

○ Adjacent · RICS, global commercial · Section 3

0 / 11

None of the 11 UK investor-buyers in our pilot audit mentions AI publicly or offers a structured deal-submission system.

● Observed · Pilot audit, small sample · Section 5

01 · Section

Why this report exists

No public dataset measures AI use among UK founder-led residential property investment firms. This report is the first attempt to describe them.

There is good official data on AI in UK business as a whole, and some industry data on commercial property and letting agents. None of it isolates the firms this report is about: founder-led businesses buying, refurbishing and holding or trading UK residential property, typically acquiring 30 to 150 units a year with 8 to 40 staff. We call this group "firms like yours" throughout.

Rather than borrow figures from other sectors and present them as yours, we show what is measured, what is adjacent, and what we could observe ourselves, and we label each one.

What is measured

- AI adoption across all UK businesses (ONS, DSIT)
- The broad "finance and real estate" band (DSIT)
- Global commercial property (RICS)
- Commercial landlords and letting agents (vendor surveys)
- Buy-to-let company formation and HMO stock

What is not

- AI adoption among UK residential investment firms
- How many firms match the profile above
- How these firms source, assess and offer on deals
- What tools they use and whether they connect
- The real estate figure inside ONS business survey data

What this means for your firm

Any claim that "property investors are behind on AI" is a guess. Nobody has the data. That makes your own position unknown to competitors too, and it means the firms that build properly now are setting the benchmark rather than chasing one.

Wide, not deep

1.6

AI technologies per adopting UK business in June 2026, up from about 1.4 in late 2023.

Measured · ONS, 20 July 2026 [1]

AI is now everywhere in UK business. In most firms it is one or two tools on the side of the work, not part of how the work is done.

The ONS puts AI use at about 35% of UK businesses with 10 or more employees in June 2026, up from about 12% in September 2023.[1] Over the same period the number of AI technologies used by each adopter barely moved. The ONS's own reading is that this "would imply relatively limited transformative impacts to date for most AI-adopting firms".[1] Large language models are the most common type, used by 18% of businesses.

Breadth versus depth, UK businesses with 10+ employees

Source: ONS, Artificial intelligence in UK businesses: 2023 to 2026 (BICS Wave 159). "Extensively" and daily-use questions are new; the ONS calls them "early indications".

People are ahead of firms

55% of employees in Great Britain report using AI for work or education, against 35% of businesses that report using it.[1] The two figures come from different ONS surveys, so the gap is indicative, but the direction is clear: much AI use is informal, chosen by individuals rather than designed by the business. DSIT notes that its own survey method cannot capture this kind of use.[2]

55%

of employees use AI for work or education

ONS Opinions and Lifestyle Survey, GB, May–June 2026

35%

of businesses report using AI

ONS BICS Wave 159, UK, June 2026

Most firms have not changed how they operate

DSIT's survey of 3,500 businesses with 5+ employees (fieldwork February to May 2025) found 16% using AI, 5% planning to, and 80% doing neither; 51% said AI was not relevant to them.[2] Among adopters, 85% use text generation and only 7% use agentic AI. Planned spending leans towards off-the-shelf apps (65%) and adding AI to existing tools (59%). Around half of ONS adopters report no change in headcount.[1]

Different surveys measure adoption differently. An executive survey by Bank of England-linked researchers puts firm-level AI use at about 71%, with more than 80% reporting no impact on employment or productivity.[28] The ONS attributes the gap to method: top-down executive answers versus function-by-function reporting.

What this means for your firm

Using AI is no longer a differentiator; a third of UK firms do. Depth is. If your team uses ChatGPT or Claude individually while deals still move through inboxes and spreadsheets, you are where most UK businesses are: adopted, but unchanged.

03 · Section

Property: piloting, not embedding

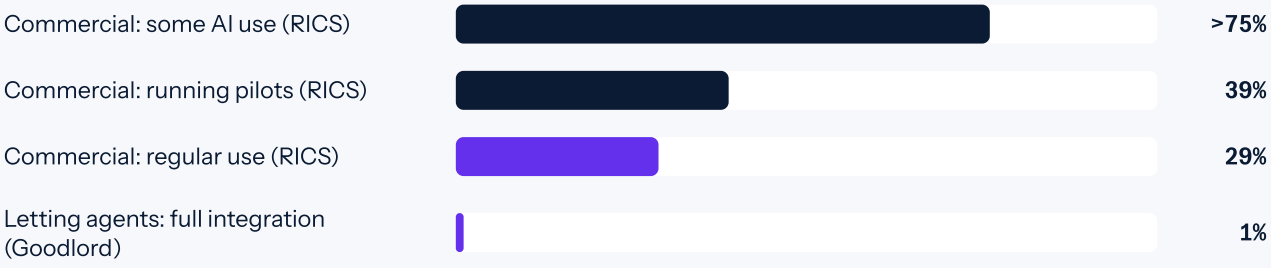

29% **of commercial property professionals use AI regularly, while 39% are still running pilots.**

Adjacent · RICS, global commercial property, Aug 2026 [3]

Your nearest measured neighbours have tried AI widely and embedded it rarely.

RICS's 2026 report, drawing on its Q1 2026 monitors, found that more than three-quarters of commercial property respondents report some AI use, but only 29% use it regularly, with RICS noting "embedded use remaining rare".[3] Vendor research points the same way: Re-Leased reports commercial landlords' active AI use rising from 32% to 57% in a year.[4] DSIT's broad "finance and real estate" band, which includes banks and insurers, sits at 21% against 16% for all firms.[2]

The pilot-to-practice gap in adjacent property segments

Sources: RICS AI in commercial property and construction report 2026 (global); Goodlord (vendor research, UK letting agents). Neither describes UK residential investment firms.

What this means for your firm

Larger, better-resourced property businesses have run their pilots and mostly not made AI routine. The hard part is the move from trial to daily operation, and that is where a firm of 8 to 40 people can move faster than an institution.

Your segment, in numbers

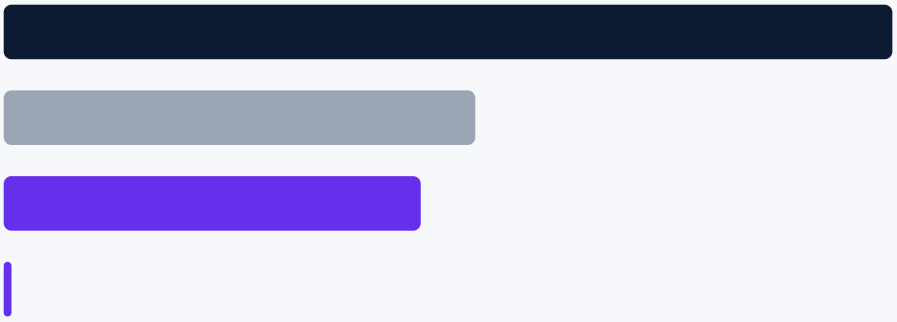

66,587 buy-to-let companies were set up in 2025, a record.

Measured · Hamptons, Companies House [6]

The market around firms like yours is large and professionalising. The number of firms like yours has never been counted.

Hamptons counts 66,587 buy-to-let company incorporations in 2025, up 8% year on year and 363% on a decade earlier, and 469,165 active BTL companies by the end of August 2026.[67] More than three-quarters of new buy-to-let purchases now go through companies.[29] England has roughly 470,000 to 480,000 HMOs depending on the source.[89] Bridging lenders in the Bridging Trends panel lent £173.1m in Q2 2026, with heavy refurbishment rising to 10% of loans and an average completion time of 46 days.[10]

From company formation to a ceiling on firms like yours, England and Wales, 2025

~81,800 properties entered BTL companies

~43,400 transfers from personal ownership

~38,400 new purchases (derived)

≤1,280 hold-strategy firms buying 30+ a year

Source: Hamptons estimates via Property Industry Eye, 14 Sep 2026. New purchases derived by subtraction. Ceiling = 38,400 ÷ 30. Labelled Analysis.

A labelled estimate

Analysis

If every new company purchase in 2025 had been made by firms buying at least 30 units a year, there could be at most about 1,280 such firms. Most purchases are made by small landlords, so the realistic number of hold-focused firms like yours is likely in the low hundreds to around 1,000.

Traders and flippers sit outside this ceiling because their stock is not necessarily held in BTL companies; no public data sizes them. Treat this as an upper bound, not a count.

469,165
active BTL companies, Aug 2026

~473k
HMOs in England (estimates vary by source)

46 days
average bridging completion, Q2 2026

Why speed matters more when the market turns

Analysis

When prices soften, motivated sellers, auction lots and portfolio disposals increase, and certainty and speed of offer decide who buys at a discount. A firm that can price a deal the same day, with evidence a lender will accept, is positioned for that market. A lower cost per deal also makes investor joint ventures and new strategies viable without adding staff.

What this means for your firm

You compete in a small field inside a crowded market. Hundreds of firms, not tens of thousands, are buying at your scale, and they are competing for the same vendors, agents and auction lots. Small advantages in speed and decision quality compound quickly in a field that size.

05 · Section

Growth is hired, not built

0 / 4 acquisitions job ads reviewed name a data tool, CRM or AI.

Observed · Job-ad sample, n=4

When these firms advertise for acquisitions capacity, they advertise for relationship labour.

Every role in our small sample is about sourcing and relationships: managing a pipeline, liaising with letting agents and council HMO teams, cold calling landlords. Three of four describe vendor or agent contact; one describes valuation or assessment. None mentions spreadsheets, comparables tools, Rightmove monitoring, a CRM or AI. Pay is often weighted towards commission.

Role	Employer type	Salary	Tasks described
Acquisitions Manager, NW London[15]	Residential value-add investor	£40k–£50k + OTE to £70k	Pipeline, researching and valuing deals, negotiating
Property Acquisitions Manager, London[16]	HMO / shared-living operator	£25k–£34k	Sourcing, viewings, letting agents, council HMO teams
Trainee Property Sourcer, London[17]	Serviced accommodation (adjacent)	Not shown	Cold calling, prospecting, landlord relationships
Sales and Acquisitions Manager	HMO sourcer / refurbisher	Not found	Not found

05 · Growth is hired, not built

Two ways to add capacity

With people

Each new acquisitions hire adds roughly one person's worth of calls, viewings and appraisals.

Advertised UK acquisitions manager pay ranges from about £47k (Jobsite average) to about £71k (Salary.com median).[23]

Judgement and buying criteria leave when the person leaves.

With systems

Intake, screening and first-pass appraisal run continuously, at any hour.

Running costs scale far more slowly than payroll as deal volume grows.

Buying criteria and past decisions stay in the business.

Comparison is Analysis. Salary figures are modelled or aggregated across sectors and should be treated as indicative.

For context outside the profile in this report, an institutional acquisitions manager role at MCR Property Group advertised £65,000–£75,000, and a development company's property sourcer role in Sevenoaks advertised "£100,000+ incl. commission". Experienced acquisitions people are expensive, and the best of them are paid for relationships, not for appraisal admin.

What this means for your firm

If the next step up in deal volume means the next hire, your growth rate is set by how fast you can recruit and train. Before the next acquisitions hire, it is worth asking which parts of that role are judgement and which are repeatable steps a system could run.

06 · Section

The tools exist. The system doesn't.

£14 **a month buys UK comparables and area data. The data is cheap. Connecting it is the hard part.**

Observed · PropertyData published pricing [18]

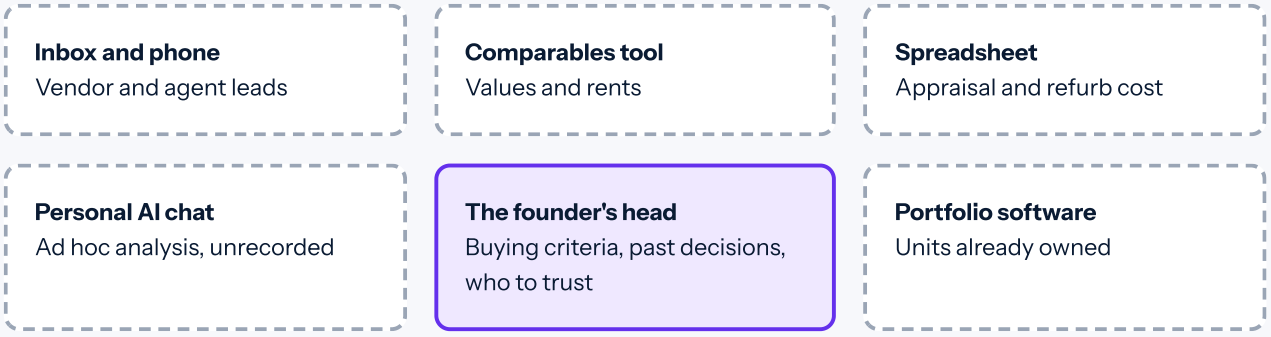

Every residential tool we found is a separate point solution, priced per user, per credit or per report. A firm can assemble comparables, site sourcing, property reports, portfolio management and data APIs for a few hundred pounds a month. Integration evidence is limited to APIs, a browser extension and one vendor's connector for AI assistants.

Tool	Does	Published price	Connects via
PropertyData[18]	Comparables, valuations, area data, HMO register	From £14/month	API plan
Searchland[19]	Site sourcing, planning, title, owner letters	From £195/licence/month, annual	AI-assistant connector (third-party claim)[26]
Sprift[20]	Property data reports, comparables	£10/report; £20–£50/month	API
PaTMa[21]	Portfolio management, compliance, deal finder	Free (1 unit); £15/month + £1.50/unit	API; Rightmove extension
Homedata[22]	Property, EPC and risk data	Free to £699/month	API-first
GetGround[24]	Ownership structuring; "AI Property Analyser"	Not found	Not found
CRM, refurb, investor relations	—	Not found in this research	—

Vendor statements about AI are reported as claims. Nimbus Maps and LandTech pricing could not be verified from primary sources and are omitted.

06 · The tools exist. The system doesn't.

Each tool holds part of the deal. None holds the decision.

Illustrative. Analysis based on the tool landscape in this report.

We found no published evidence of these tools being joined into one acquisitions workflow at a UK investment firm. Firms may integrate privately, so this absence is consistent with a gap but does not prove one.

The pattern has a cost beyond the subscriptions. When each part of the business buys its own tools, the result is a spread of disconnected products that duplicate each other, scatter the firm's data across vendors, and leave the actual decision where it started: with a few people who hold the context.

What this means for your firm

Buying another tool is unlikely to change your deal throughput. Count how many places a single deal's information lives today. That number is a better measure of where you stand than how many AI subscriptions you hold.

07 · Section

What a connected acquisitions system looks like

The useful question is not which tool to buy. It is this: if we built our acquisitions process today, with AI doing most of the repeatable work, how would we build it?

This section is our analysis. It describes the principles we see behind AI adoption that changes how a business operates, applied to property acquisitions. The workflow shown is illustrative, not a description of any specific firm.

1. Start from the constraint

For most firms like yours the binding constraint is decision capacity: how many deals can be properly assessed and priced each week. Target that first. Build in independent modules, each released into live use and proven before the next, rather than a six-to-nine-month project that goes live all at once.

2. The company brain

AI models are becoming cheaper and more interchangeable every year, so they are not where a firm's advantage lies. What a competitor cannot copy is your own structured record of the business: your buying criteria, every deal you have seen and why you did or did not buy, which agents and contractors deliver, what refurbs really cost by area.

We call this the company brain. It should be captured automatically where information first appears (calls, emails, messages) rather than typed into a CRM after the fact, and hosted in your own environment so the firm owns it.

What it holds: yours

- Every deal seen, with the decision and the outcome
- Your buying box and appraisal method
- Comparables you relied on, and valuations achieved
- Refurb costs by property type and area
- Agent, contractor and lender performance
- Call, email and message history with each party

What it connects to: public

- HM Land Registry titles and price paid
- EPC register
- Local authority planning and Article 4 maps
- HMO licensing registers
- Comparables and rental data from the tools in section 6

07 · What a connected system looks like

Where AI applies across the deal lifecycle

Acquisitions intake is where most firms feel the constraint first, but margin is won and lost across the whole lifecycle. This map shows where the time goes today and what a connected system would take on at each stage.

Stage	Where time goes today	What a connected system does	Check it runs
Source	Agent calls, auctions, letters to owners	Watches Land Registry, planning and probate data for off-market stock; logs every lead	Ownership and title match
Underwrite	Comparables pulled by hand into a spreadsheet	Drafts the appraisal from comparables and your past refurb costs	Article 4, HMO licensing, EPC rating
Buy	Legal pack, title and survey read line by line	Reads the pack and survey, flags issues for your solicitor	Vendor ID and source-of-funds record
Refurb	Quotes and overruns tracked in spreadsheets	Compares quotes with your cost history; tracks budget against plan	HMO standards and room sizes
Refinance or let	Valuer evidence assembled by hand	Builds the comparable evidence pack for valuer and lender	EPC minimum, licence in place
Hold or exit	Portfolio performance reviewed occasionally	Flags underperforming units and refinance windows	Licence and certificate renewals

Illustrative deal economics

☐ Analysis

400
leads a month, same team

30 → 60
offers, once screening and first appraisal are automated

+1.5
completions a month, even at half the usual conversion on the extra offers

Hypothetical firm converting 10% of offers. Figures show the mechanism, not a forecast or audit finding.

07 · What a connected system looks like

One deal through acquisitions, before and after · illustrative

	TODAY	CONNECTED
Intake	Form, call or email lands with whoever is free	Every lead captured in one place, any channel, any hour
Screen	A person checks it against criteria in their head	Written buying box applied automatically; misfits declined politely
Appraise	Comparables pulled by hand into a spreadsheet	Draft appraisal assembled from data tools and your past deals
Decide	Waits for the founder	Founder reviews a prepared case and only the edge cases
Learn	Outcome rarely recorded	Every decision and outcome feeds the company brain

3. Three layers of decision

Reliable systems do not hand everything to AI. They split the work into three layers, and the design of that split comes from the people who do the job today. Their unwritten rules and edge cases are what make the system work; systems built without them tend to fail in live use.

Fixed rules
Hard criteria, written once and applied every time. For example: decline anything outside target postcodes or under 7% gross yield.

AI judgement
Used only where there is unstructured information to read or a judgement to draft: listing text, photos, agent emails.

People on the edge cases
When confidence is low or stakes are high, a named person decides with the case prepared. For example: every offer over £250k.

4. Treat it as a capital allocation decision

Each module should clear a baseline return before it is built. A simple test:

Time saved × loaded labour cost × frequency × share automated

The honest version also counts the hidden costs that never appear on a timesheet: deals lost to slower offers, leads that arrive out of hours, junior rework, and the time it takes a team to change how it works. Success is then measured with business numbers rather than "hours saved":

Revenue per employee
Growing deal volume without growing headcount at the same rate

Cycle time
Days from first enquiry to offer, and from offer to completion

Capacity utilisation
Share of the team's time spent on negotiation and relationships, not admin

Cost per completed deal
All acquisition costs divided by completions

Software and running costs grow slowly as volume rises, while payroll grows in step with it. Over time, that difference is where the margin comes from.

What this means for your firm

The first step is not technical. It is writing down your buying box, how you appraise, and where deals stall. That document is the foundation of the company brain, and most firms in this segment have never produced it.

The business case, in pounds

Analysis

A worked example of the baseline test for one module, appraisal drafting, at a hypothetical firm. Replace each input with your own.

15 hrs	£35	48	60%	=	≈ £15,100
a week on appraisal admin	loaded hourly cost	working weeks	share automated		a year in time released

That figure is the floor. The larger return is usually on the revenue side: offers made the same day, out-of-hours leads answered, and more deals assessed by the same team. If faster offers win one extra deal a quarter at £20,000 profit, that is £80,000 a year from the same module.

Buy, subscribe or build?

	Point tools	Off-the-shelf platform	Your own connected system
Upfront cost	Low	Low to medium	Medium, phased by module
Fits your process	You adapt to each tool	You adapt to the platform	Built around how you buy
Who owns the data	Spread across vendors	The platform	You
Connects the decision	No	Partly	Yes
Main risk	More disconnected subscriptions	Lock-in; generic logic	Needs your team's input to build

Point tools still have a place: a connected system uses them as data sources. The choice is whether anything joins them up.

5. Build the compliance checks in

Every deal already passes through checks your team runs by memory or by checklist. A connected system runs them on every deal, records that they were run, and stops a deal that fails. These are the checks most relevant to residential investment firms.

AML/KYC	Identity and source-of-funds records for vendors, joint-venture partners and private investors, kept with the deal file. Your solicitor and agents run their own checks; the system keeps your evidence in one place.
UK GDPR	Vendor, tenant and investor data processed with a lawful basis, retained for a defined period, and never sent to a model provider that trains on it. This is one reason to host the company brain in your own environment.
HMO licensing and Article 4	Checked at underwriting, not after exchange: whether the street sits in an Article 4 area, whether mandatory or additional licensing applies, and whether room sizes meet the local standard.
EPC and MEES	Current rating and the cost of reaching the letting minimum, built into the appraisal so an upgrade bill never arrives as a surprise.
Tenancy law	Changes under the Renters' Rights Act 2025 affect how units are let and managed. Lettings templates and processes should be updated in one place, not in each person's inbox.

Analysis. A summary of common obligations, not legal advice. Confirm requirements for your structure and local authorities with your advisers.

6. Bring your team with you

~50% **of UK AI adopters report no change in headcount.**

Measured · ONS, July 2026 [1]

The first question most founders ask is whether this replaces their acquisitions manager. In a firm built on relationships, it should do the opposite: take the admin off the people who negotiate, so their time goes on vendors, agents and lenders.

How roles change

Acquisitions: from appraisal admin to negotiation and relationships

Project managers: from chasing quotes to managing exceptions

Founder: from every decision to the edge cases and the strategy

What makes it stick

Build each module from the knowledge of the person who does the job, so they own it

Release one module at a time and prove it in live use

Measure usage, not just output; unused tools are the usual failure

Tools that teams ignore are the most common way these projects fail. A system people actually use is one built with them, around how they already work, that saves them time from the first week.

What this means for your firm

Before you build anything, name the person who knows each process best and make them part of designing it. Their unwritten rules are what make a system reliable, and their involvement is what makes the team use it.

08 · Section

Where does your firm sit?

Four stages, from manual to AI-native. Most UK businesses with AI are at stage one.

0 Manual

Deals flow through inboxes, phones and spreadsheets. AI is not used, or only privately.

You are here if: nobody could tell you how many deals came in last month.

1 AI-enabled

Staff use tools like ChatGPT or Claude individually for 10–20% efficiency gains. The workflow is unchanged.

You are here if: every deal still waits for the same person.

2 AI-first

Intake, screening and appraisal are rebuilt with AI doing the repeatable work. Staff manage and review.

You are here if: your buying box is written down and applied to every lead.

3 AI-native

The business runs on a connected system and a company brain. Deal volume grows with minimal added headcount.

You are here if: a new hire can see every past decision and why it was made.

Stages are Analysis. The 10–20% range for stage one is indicative, not measured for this segment.

Use the ladder honestly. Most firms that describe themselves as using AI are at stage one: individuals are faster, but the business works the same way it did before. The move from stage one to stage two is where the gains in this report start.

08 · Where does your firm sit?

A phased route from stage to stage

Analysis

Each phase ships something that works in live use before the next begins. Timings are indicative for a firm of 8 to 40 staff.

Weeks 1–4	**Write it down** Buying box, appraisal method and where deals stall. Baseline cycle time and cost per deal.	Stage 0 → 1
Weeks 5–12	**Intake and screening** One place for every lead, any channel. Buying box applied automatically. First module live.	Stage 1 → 2
Months 4–6	**Appraisal and company brain** Draft appraisals from comparables and past deals. Every decision and outcome recorded.	Stage 2
Months 7–12	**Extend across the lifecycle** Legal pack and survey reading, refurb cost tracking, refinance evidence packs, compliance checks.	Stage 2 → 3

Next step

Take the acquisitions maturity assessment.

Twelve questions on intake, appraisal, decisions and data. You get your stage, the constraint holding you there, and the first module worth building.

Methodology and limitations

This report is built entirely from publicly available sources accessed up to 5 October 2026. These include official statistics (ONS, DSIT), professional and industry bodies (RICS), lender, agent and vendor research (Hamptons, Paragon, Bridging Trends, Re-Leased, Goodlord), vendor pricing pages, and a small sample of public job adverts. No surveys, client data or interviews were used. Figures from adjacent sectors (commercial property, all UK businesses, financial services, letting agents, non-UK markets) are labelled as context and do not describe UK residential investment firms. Vendor statements about AI are reported as claims. The job-ad sample (n=4) is small and non-random, so counts are indicative only. Where no source exists, we state "No public data found". Estimates are labelled as analysis with workings shown.

Known gaps

AI adoption among UK residential investment firms or landlords: no public data found.

Company counts and size bands under SIC 68100 and 68209 were not retrieved.

Bridging totals beyond the Bridging Trends contributor panel were not retrieved.

No verified founder quotes on AI or acquisitions bottlenecks were captured.

The real estate figure in ONS BICS Wave 159 sits in chart data and was not extracted.

The number of firms matching this report's profile has never been counted.

No UK headline figure was found in Re-Leased Market Lens 2026.

Pricing for CRM, refurb and investor-relations tools was not found.

Caveats

Several 2026 figures reached us through secondary reporting (Property Week, LexisNexis, Property Industry Eye) and will be checked against primary publications before the 2027 edition. HMO counts differ by source because they measure estimated stock, licensed stock or registered stock. The ONS 35% and the executive-survey 71% differ mainly because they measure adoption differently, as the ONS notes. The worker and business AI figures (55% and 35%) come from different surveys with different coverage (GB and UK).

AGI Automations

About AGI Automations

We build AI systems people actually use, for UK property businesses that want measurable results rather than experiments.

We turn a firm's operational knowledge into a system the business owns: its criteria, its decisions and its history, connected to the work. We publish this report because nobody else measures firms like yours, and we think the segment deserves a benchmark.
